ABOUT GREE

Gree Electric Appliances, Inc. of Zhuhai was founded in 1991 and was listed on the Shenzhen Stock Exchange in November 1996. At the beginning, Gree was only a company that assembled residential air conditioners. Now it has grown into a diversified global technological industrial group that has expanded its business to household consumer goods and industrial equipment under three brands: GREE, KINGHOME and TOSOT. Gree is the number one brand of air conditioners in the world in 2022*.

- 2005 • Gree has topped No.1 in production and sales volume of residential air conditioners for 14 consecutive years.
- 2015 • Gree's sales revenue exceeded 15.08 billion USD.
- 2016 • Gree's sales revenue exceeded 16.51 billion USD.
- 2017 • Gree's sales revenue exceeded 22.21 billion USD.
- 2018 • Gree entered into the list of Forbes Global 2000 again and ranked No. 294, moving up 70 places compared with the previous year. Gree's sales revenue exceeded 30.23 billion USD.
- 2019 • Gree entered into Fortune Global 500. Gree's return on equity (ROE) ranked the first among the 129 Chinese enterprises on the list.
- 2020 • Gree has ranked the 436th on the list of Fortune Global 500.
- 2022 • Gree has ranked the 487th on the list of Fortune Global 500.
- 2023 • **Gree Entered into the list of Forbes Global 2000 again and ranked No. 331.**

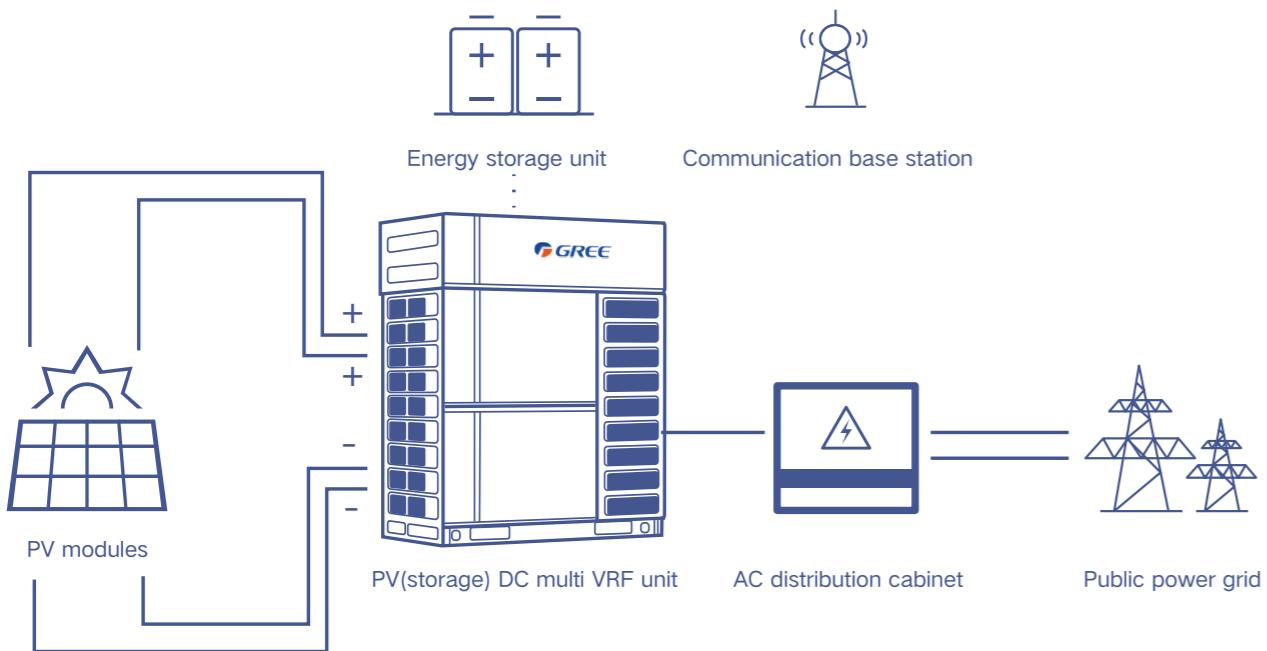

Gree brands are sold widely to more than 190 countries and regions. Action makes the future and innovation makes achievement. Looking forward, Gree will press ahead with its business philosophy of passion, innovation and realization. We aim to build a centenary air conditioning enterprise and create a better life for humankind.

*Gree is the number one brand of air conditioners in the world in 2022;

PV (storage) DC multi VRF unit

Introduction

Photovoltaic (Storage) Energy System (Customized)

Gree Photovoltaic (Storage) DC multi VRF system is a clean, safe, reliable, intelligent and efficient new energy air-conditioning integrated system. The system includes photovoltaic power generation system, energy storage expansion system, HVAC system and G-IEMS energy information management system. The system can be flexibly combined with multiple modules, and provides a complete power generation system solution according to customer/user needs, with outstanding economic benefits. It has been widely used in household, commercial and light industry applications, meeting different applications in factories, buildings, schools, hotels, hospitals, residences, office buildings, laboratories, exhibition halls, commercial complexes, etc.

The system integrates many core technologies such as "photovoltaic (storage) DC direct-driven technology", "multi-terminal multimode commutation technology", "four-quadrant full-controlled rectification technology", "full network adaptive technology". It has successively obtained IEC, UL, CE, IEEE, DEWA, SAA and other international mainstream certifications. Products have been widely used in 25 countries and regions such as the United States, Saudi Arabia, Spain, Australia, Brazil, Nigeria, Singapore, UAE, etc., truly providing global customers/users with high-value green energy system services.

Qualification and Honors

China Patent Gold Award

Geneva International Invention Gold Medal

International Quality Innovation Award

British RAC Cooling Industry Award

- 2013 • The photovoltaic air-conditioning system "without electricity charges" was developed, and the relevant technical achievements had been certified by authoritative institutions to reach the "world leading" level.
- 2014 • Completed the development of the full series of first-generation photovoltaic multi VRF system. Gree photovoltaic air-conditioning system began to serve the world.
- 2015 • The photovoltaic direct-driven inverter centrifuge system project won the "British RAC Cooling Industry Award".
- 2016 • Photovoltaic direct-driven inverter air conditioner technology has entered the "National Energy Saving and Emission Reduction Promotion and Application Catalogue" for 5 consecutive years since 2016.
- 2017 • The R&D and application of photovoltaic DC direct-driven inverter air conditioning system won the "International Quality Innovation Award" of Spain.
- 2018 • The "air-conditioning optical storage direct current key technology and application" project results had reached the "world leading" level after authoritative appraisal; the independent patent* "photovoltaic direct-driven system and its control method" won the Chinese patent gold medal.

5 Working Modes

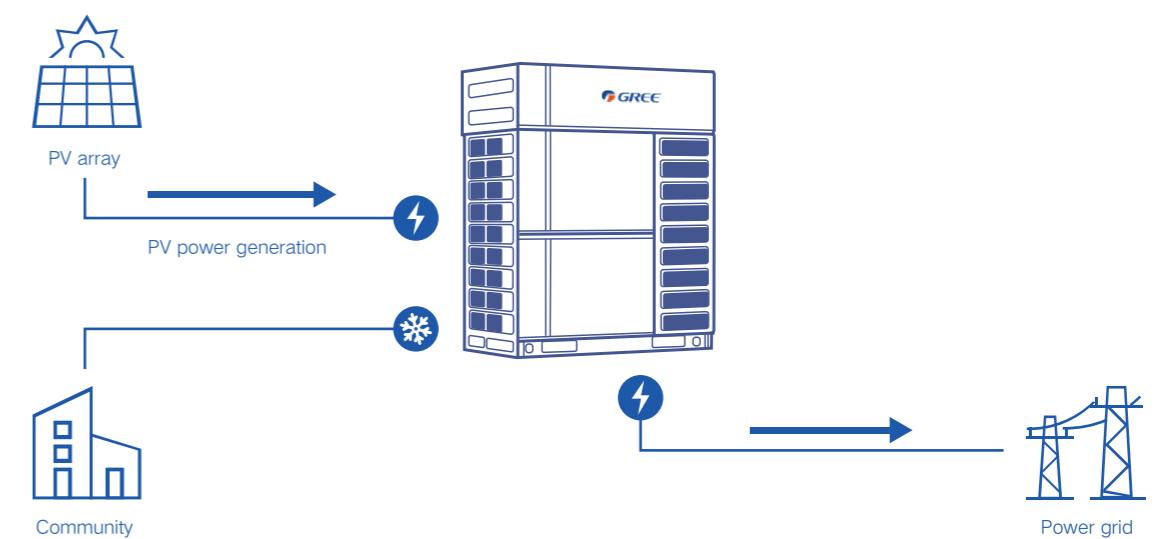

Gree photovoltaic (storage) DC multi VRF system is composed of PV system, energy storage system, air conditioning system and energy information management system. The air conditioning is the center of energy and information, PV is the source of clean electricity, while energy storage is optional. Let's explain it from its five working modes.

1

PV power generation mode

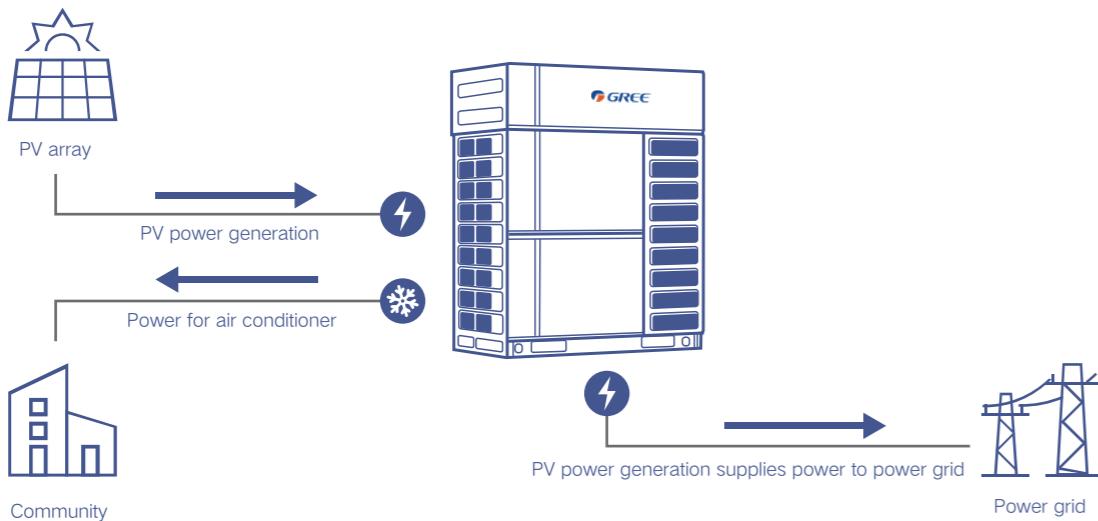

When the user has no cooling demand, the air conditioner does not need to work, then the system is equivalent to a PV power station, and the PV power can be supplied to other appliances or to the grid, creating economic benefits for users.

2

PV air conditioning and power generation mode

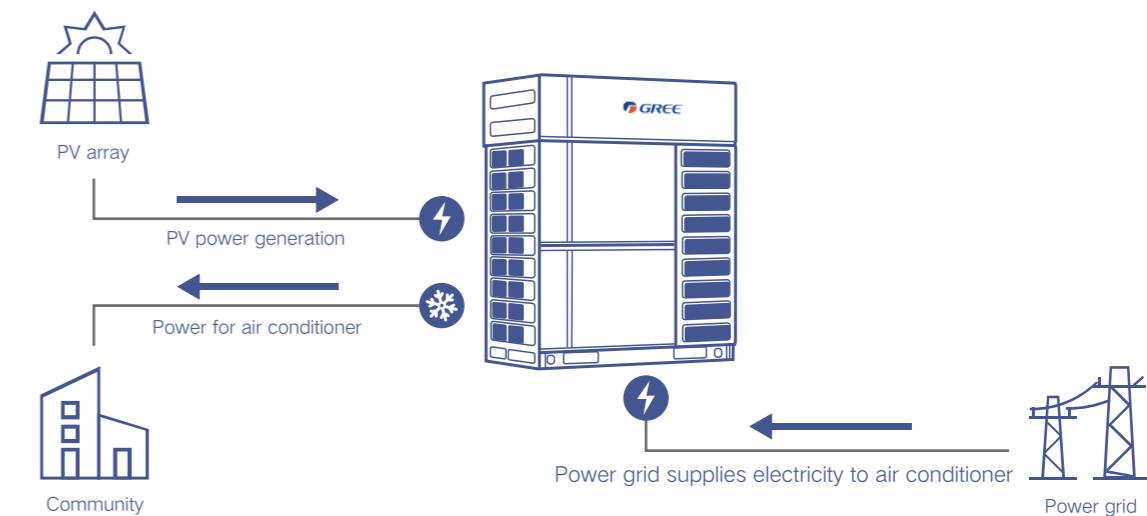

In the case of sufficient sunlight, when PV power is more than the power consumed by air conditioners, PV power is given priority to air conditioners, while the residual PV power is supplied to other electric appliances or public power grid. Thus, additional benefit is brought to users.

4

Hybrid power supply mode

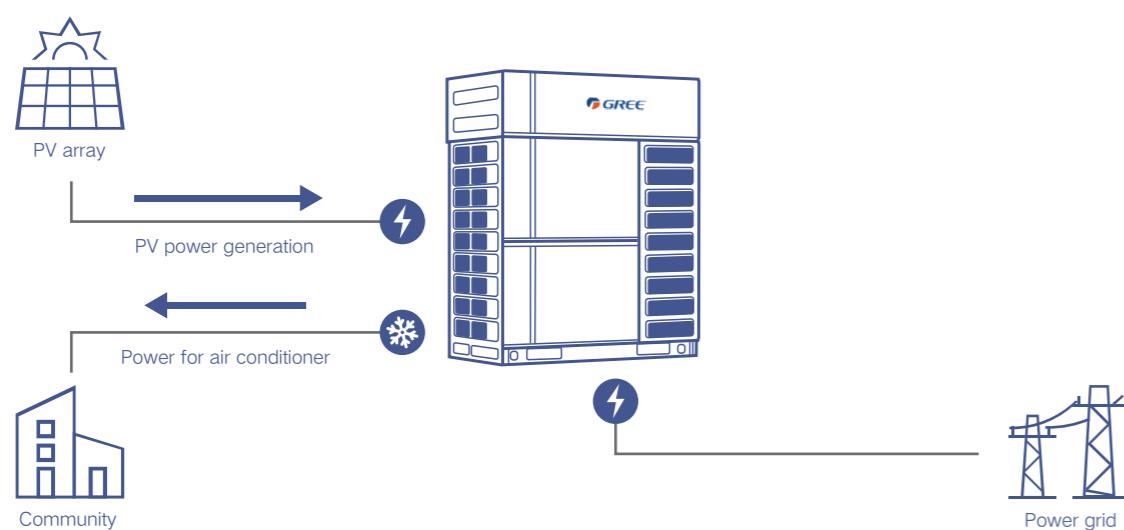

In the case of insufficient sunlight, when PV power is less than the power consumed by air conditioners, PV power is given priority to the air conditioners, and the public power grid will supplement the power for the realization of hybrid power supply.

3

PV air conditioning mode

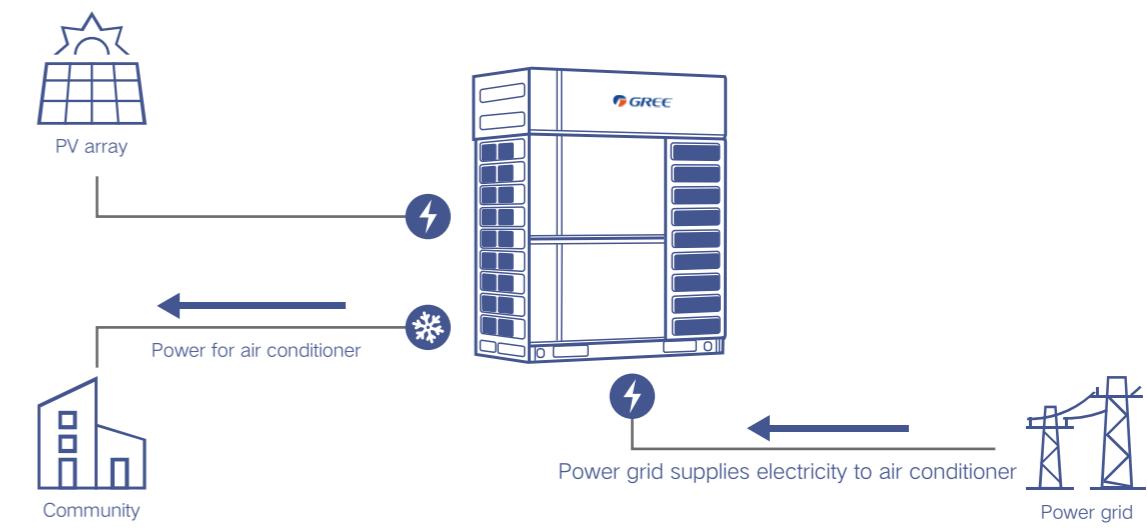

When PV power is equal to the power consumed by air conditioners, the air conditioning power is completely provided by PV power, which truly achieves the effect of zero carbon emission.

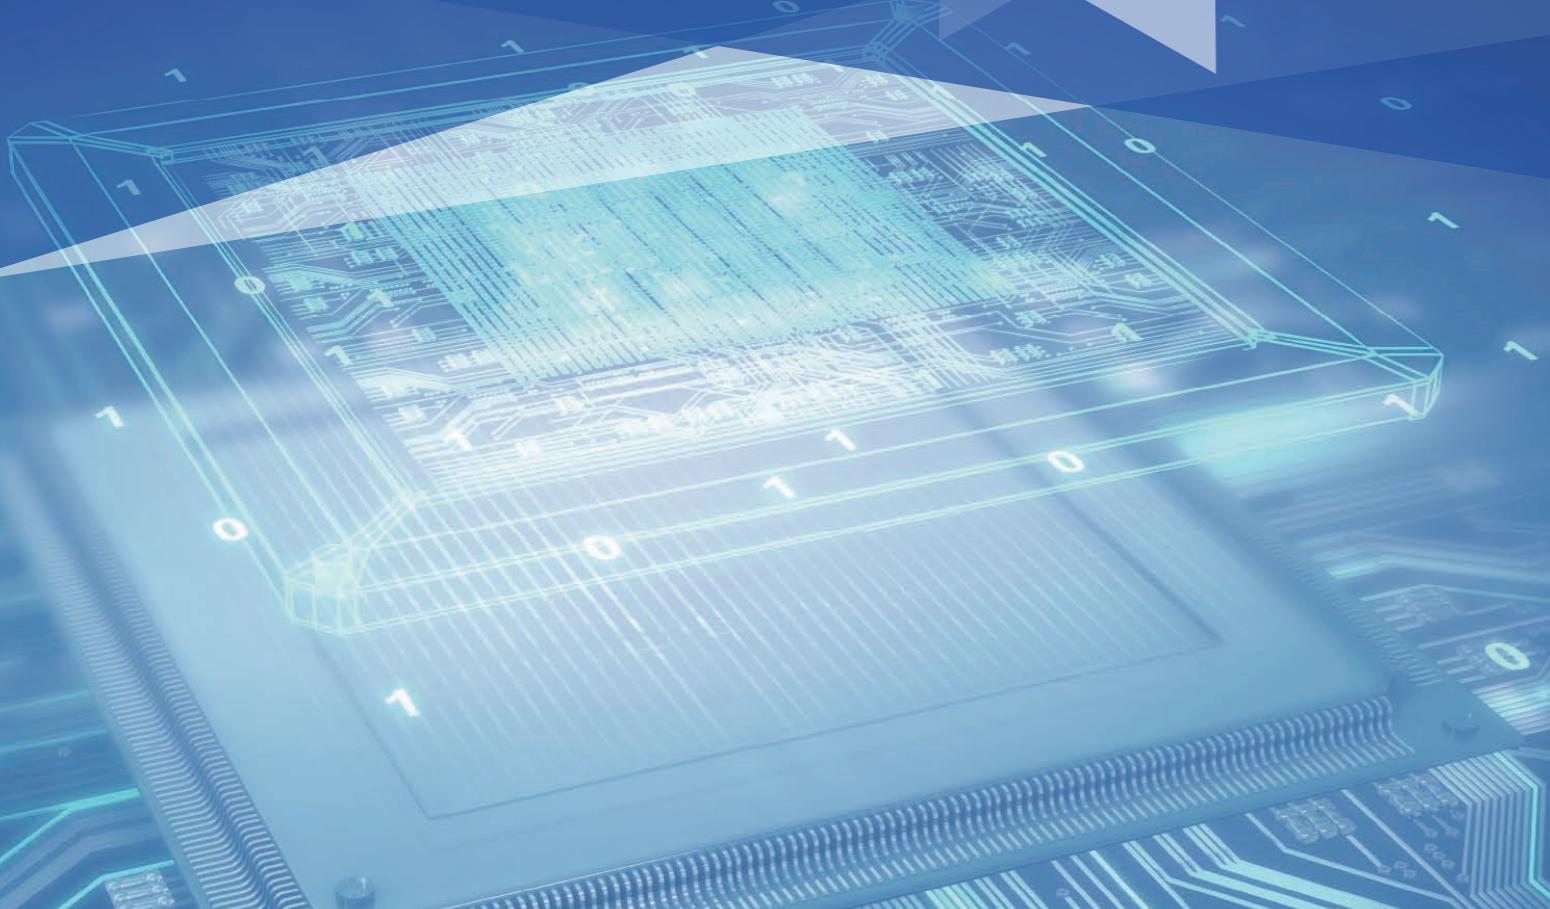

5

Air conditioning mode

In the evening or the weather without sunlight, the photovoltaic system cannot generate electricity, all the electricity required for air conditioning comes from the public power grid, then the system is a conventional air conditioning system.

Electricity Charge Photovoltaic (Storage) DC Direct-driven Technology

Gree Electric has always been committed to the research and innovation of low-carbon energy-saving technologies. The self-developed photovoltaic (storage) DC direct-driven technology perfectly combines photovoltaic power generation and power consumption of air conditioner, forming a photovoltaic (storage) DC multi VRF system. The system runs with high energy efficiency and can realize zero electricity charge for comprehensive operation, which can remove the stereotype of "electric tiger" for air conditioners.

Efficient combination of new energy and air conditioner
The system has both power generation and backup functions

Photovoltaic (storage) DC direct-driven technology. Photovoltaic (storage) DC power directly drives the operation of air conditioners. The direct-driven utilization rate reaches 98%. It is high-efficiency and self-sufficient.

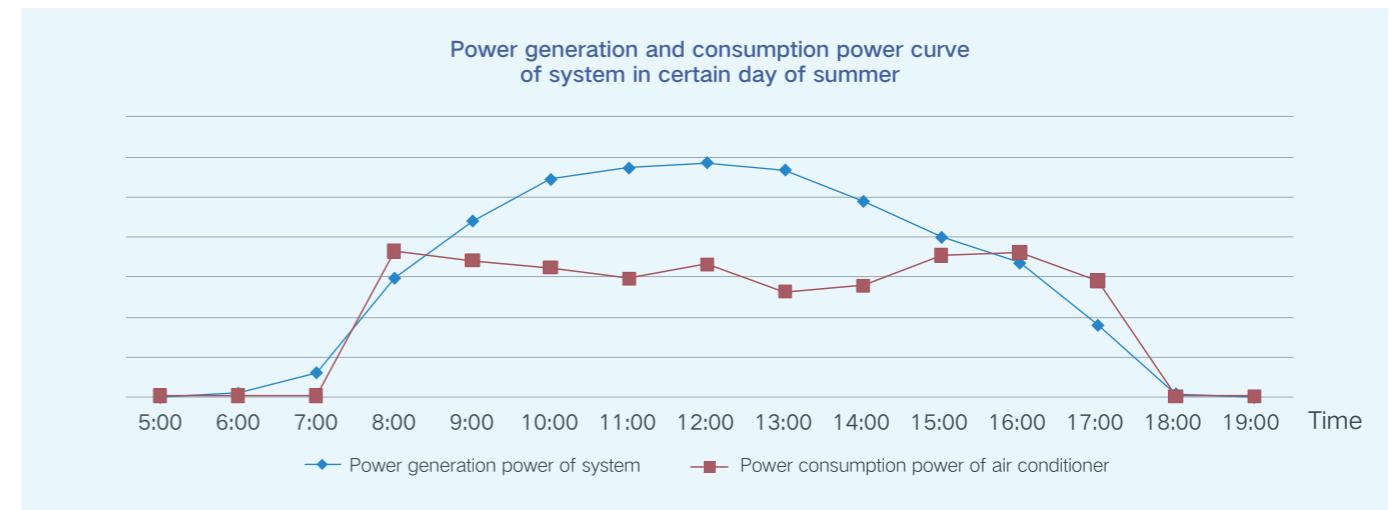

Compared with the non-direct-driven system, it saves multiple AC-DC conversion processes, reduces equipment investment, and improves system efficiency by more than 6%.

The innovative dynamic load tracking MPPT technology can track the maximum power point generated by the photovoltaic system in real time. Combined with the electricity consumption characteristics of the air conditioner, it realizes the maximum utilization of photovoltaic power by the system.

- ▶ The electricity consumption characteristics of air conditioners are consistent with the characteristics of photovoltaic power generation
- ▶ High self-sufficient and self-utilization rate

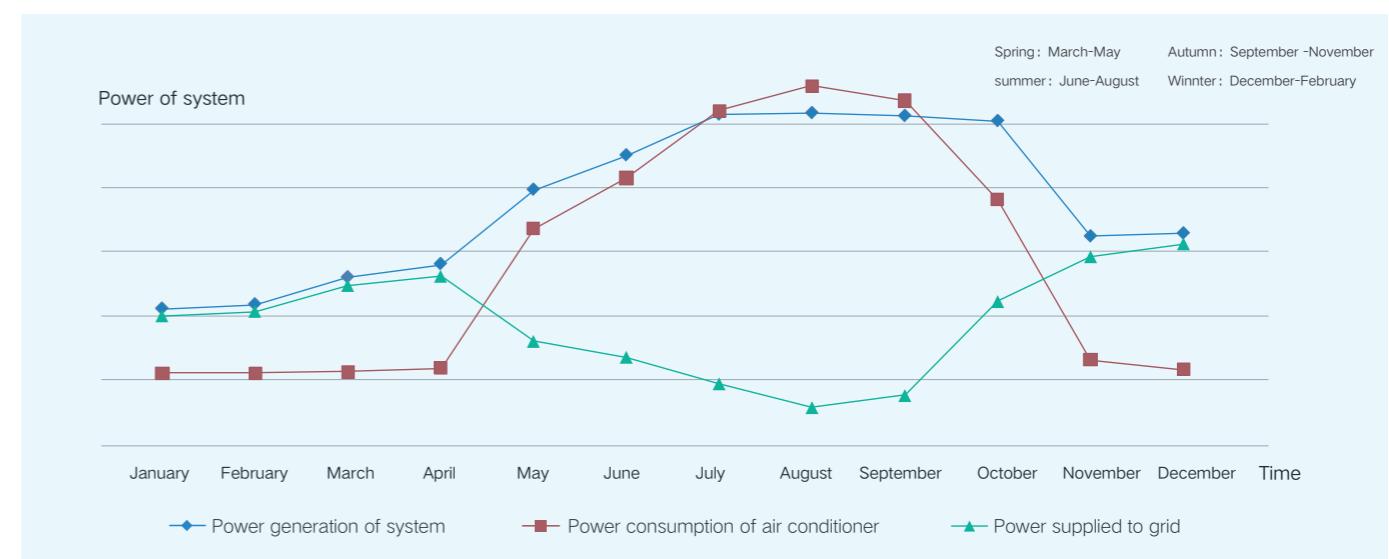

Taking the application in summer as an example, the intensity of solar radiation is high. At this time, photovoltaic power generation and air conditioning power consumption are relatively high. Meanwhile, the characteristics of photovoltaic power generation and air-conditioning electricity consumption are consistent, so that the self-sufficient and self-utilization rate of the system is high.

Under certain conditions, the system can be self-sufficient.

- ▶ The system's annual power generation and consumption are flat, and the comprehensive power consumption of the grid can be zero

According to the rated design requirements of the system, the photovoltaic power generation capacity is equal to the system power consumption in the whole year (the power drawn by the system from the power grid is equal to the power generated by the system and supplied to the power grid), and the comprehensive power consumption of the power grid is zero.

*Zero electricity charge means under certain using habit, power generation of system in the whole year period \geq power consumption of system, thus there is no need to pay electricity charge after comprehensive amortized computation.

Waste

Multimode Commutation Technology

Gree photovoltaic (storage) DC multi VRF system adopts self-developed multimode commutation technology to realize rapid switching of photovoltaic power generation, air conditioning power consumption and power grid interaction. The dynamic switching time of the five types of working modes is less than 10ms. The power of the system is given priority to ensure the operation of the air conditioner, and the surplus power is stored or connected to the power grid in real time to realize the full utilization of photovoltaic power and avoid waste of power generation and consumption.

Fast switching, no delay in power generation

The switching time of the five working modes of the system is less than 10ms

Multi-energy complement, uninterrupted power consumption

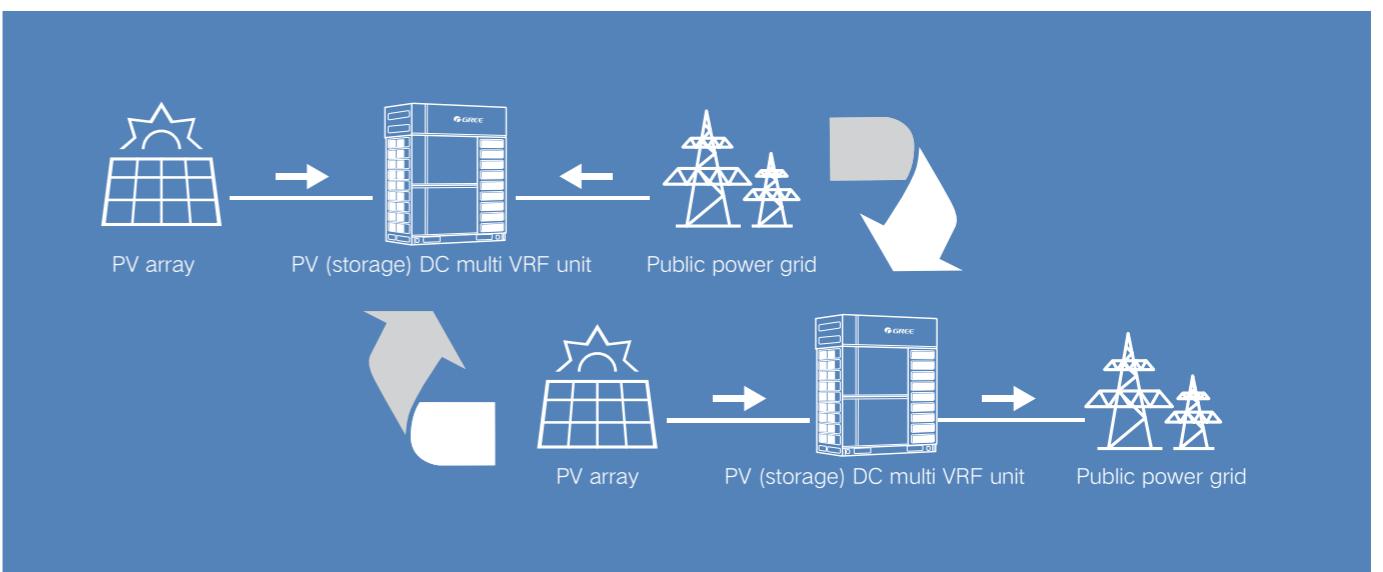

Multi-energy linkage among photovoltaic storage, load and power grid; photovoltaic takes priority, energy storage for complement, power grid for support

Real-time power grid connection, no waste of surplus electricity

Surplus electricity can be stored or connected to power grid in real time to realize full utilization of photovoltaic power

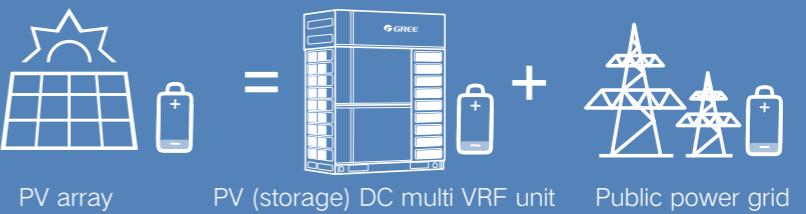

Fast switching, no delay in power generation

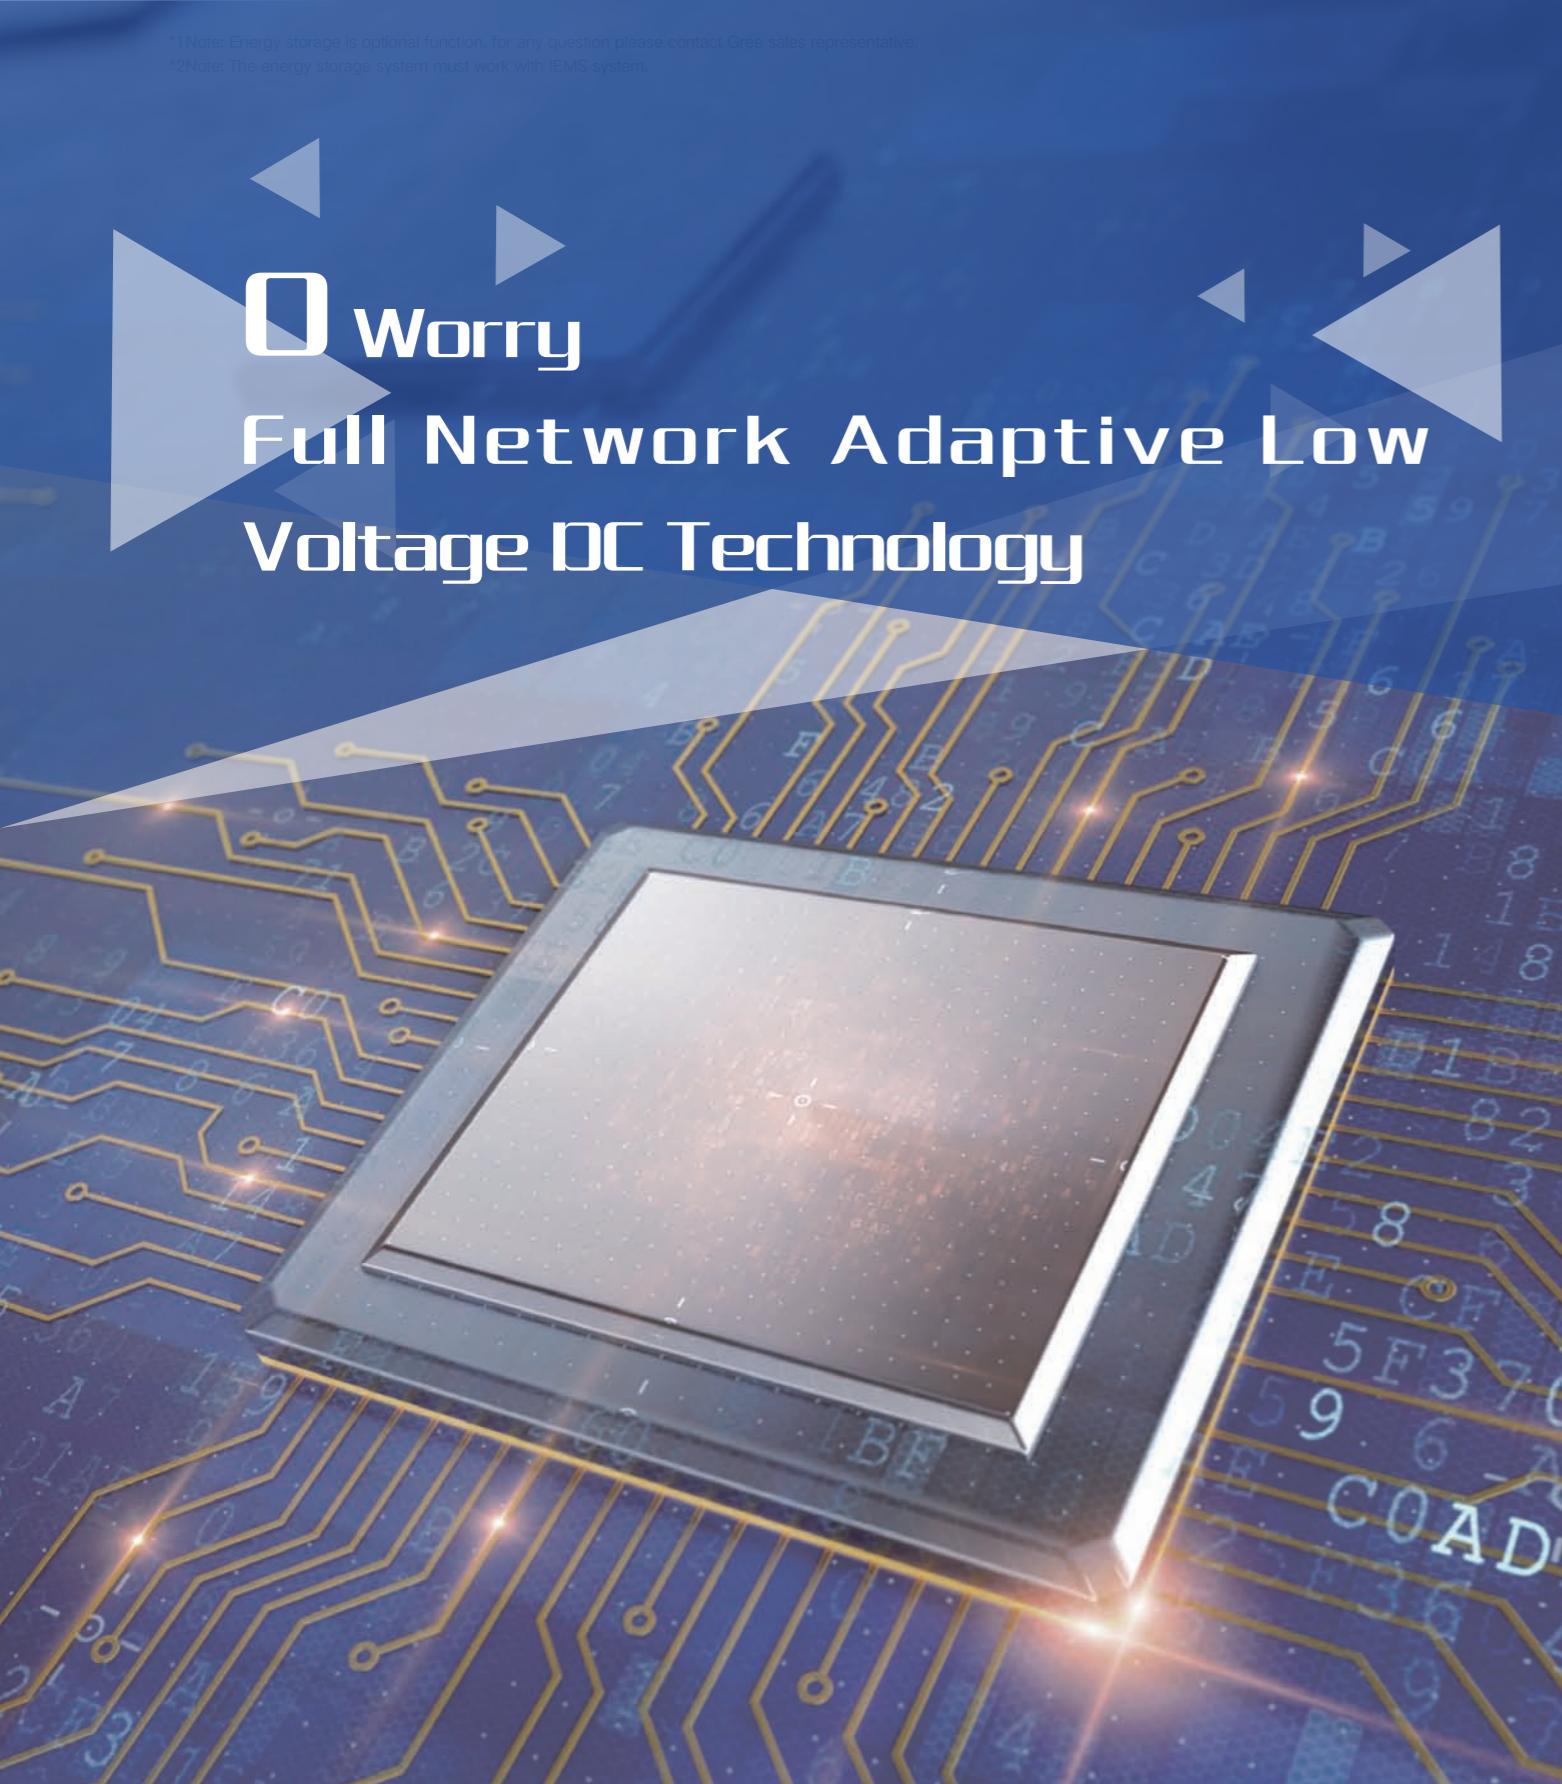

The multimode commutation model constructed by photovoltaic system, air conditioning system and power grid, the system DC bus is accessed, and electric energy can flow in both directions and can achieve multi-channel mixing on the DC side, ensuring the fast and free switching of the five modes of the system.

Real-time power grid connection, no waste of surplus electricity

When there is still a surplus after the photovoltaic power meets the application requirements of the system, the system power can be connected to the power grid in real time, which can be used by other electrical equipment to realize the full utilization of photovoltaic power.

Gree photovoltaic (storage) DC multi VRF system is based on customer/user needs, after years of iterative development, technology and product have undergone continuous innovation, such as full network adaptive technology of grid, dual-friendly four-quadrant inverter technology, intrinsically safe low voltage DC technology, etc. for high-quality upgrade of system, bringing customers/users a safer, more reliable and worry-free energy system service.

Full network adaptive green inverter, no need to worry about grid interaction

The voltage system is self-adaptive, and the grid frequency is self-adjusted. Using four-quadrant full-controlled rectification technology, the power factor reaches 0.99 when the air conditioner is running at rated power, and the total harmonic content is less than 1.5%, realizing both system-friendly and eco-friendly.

Low-voltage and DC component, no need to worry about safety for maintenance

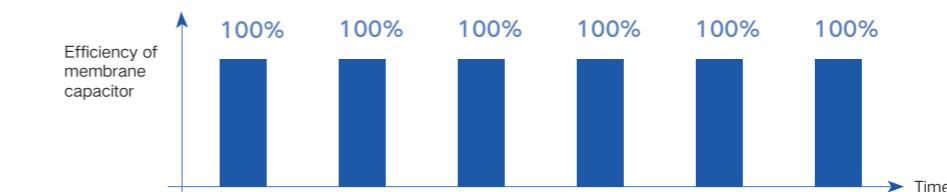

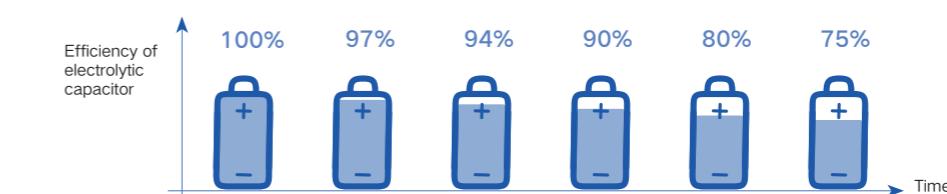

Photovoltaic (storage) DC air conditioner adopts low-voltage DC components to ensure the safety of the unit, reduce the hidden dangers of unintentional electric shocks in the use and maintenance of the unit, reduce the arcing and fire hazards caused by the aging of the wires, and improve the EMC performance.

Without neutral wire, no need to worry about engineering installation

The system adopts the design idea of low-voltage power distribution circuit and the cancel of the zero wire to eliminate the influence of phase sequence, which can completely eliminate the problems of reverse engineering phase sequence connection and virtual zero wire connection, expanding the adaptability of unit engineering, and reducing engineering installation costs.

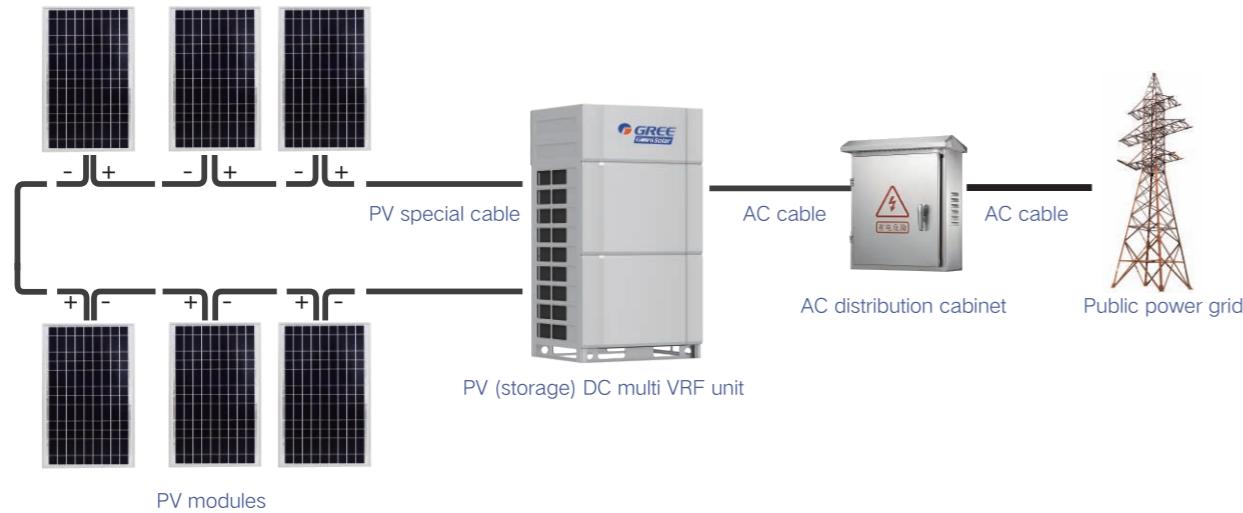

Membrane capacitor, no need to worry about the service life of unit

Membrane capacitors have the advantages of high voltage resistance, non-polarity, and ability to withstand high forward and reverse high pulse voltages. Photovoltaic (storage) DC air conditioners use film capacitors to replace electrolytic capacitors, and the unit has a longer service life.

► Complete and simple photovoltaic module assembly, convenient and worry-free

According to the climatic conditions of the project location, parameters of photovoltaic DC multi VRF unit and photovoltaic module series, Gree provides users with more space for photovoltaic modules. The photovoltaic DC multi VRF unit reserves the photovoltaic industry common interfaces for easy plug and users, so that users can use it conveniently.

► Expanding the energy storage system to meet the needs of diverse application scenarios, with powerful functions

Gree Intelligent Energy Storage System is an integrated intelligent energy storage system that integrates energy storage cells, BMS and DC/DC. It balances charge and discharge throughout the life cycle and operates intelligently by means of information, which brings excellent economic benefits to users. After the photovoltaic DC multi VRF system is matched with the energy storage system, the energy complementary architecture is improved, the system working mode is expanded, the system supply and demand linkage performance is further optimized, and the multi-scenario adaptive operation is intelligently realized.

Power distribution side
Adjust peak and frequency, reduce peak load

Residence
Storage energy for users, step tariff
Maximize the benefit

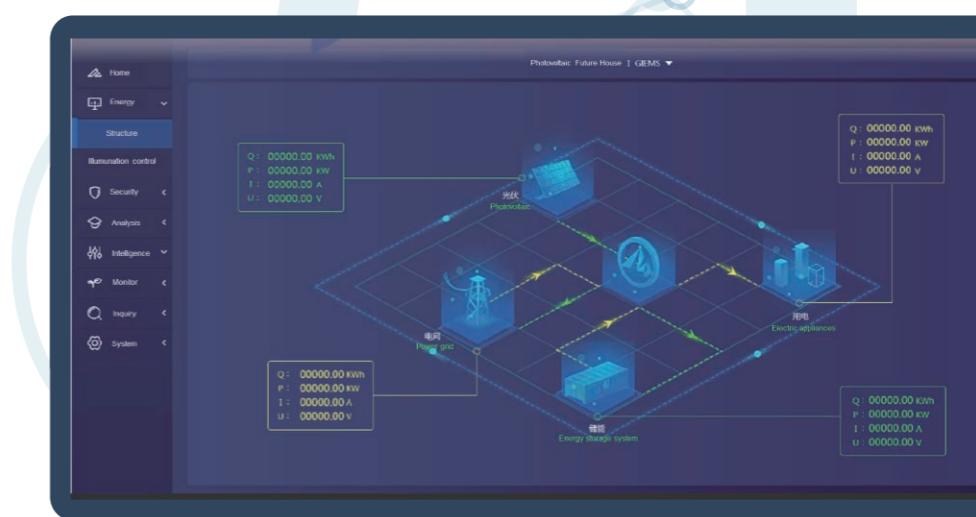

Data center
Provide uninterrupted power supply for
important situation

Renewable energy
Distributed energy storage unit

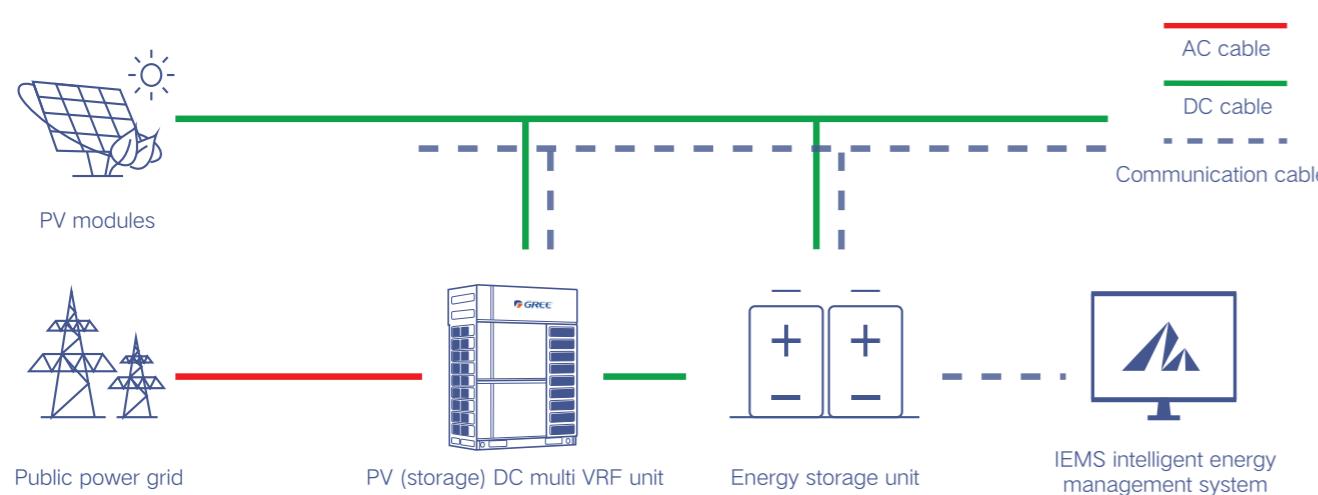

► Equipped with G-IEMS energy information management system, real-time monitoring of energy flow, intelligent management

Gree Energy Information Management System (G-IEMS) is an energy dispatching management system that combines unique DC direct-driven technology to realize the linkage of source, storage, network, load and storage. It integrates clean power generation, high-efficiency power consumption, real-time monitoring, lightweight interaction, supports energy dispatching and refined management, with power-level operation response, voltage/current level status diagnosis and balance regulation. It can realize functions such as safety management alarm, real-time energy monitoring, equipment intelligent control, energy efficiency expert analysis, etc., to achieve the purpose of safe use, intelligent management, energy saving and emission reduction.

Note: The energy storage system must work with IEMS; if a certain multi VRF system is without energy storage system, it should use photovoltaic centralized controller to conduct monitoring.

► Simple Version of Solution for Photovoltaic DC Multi VRF System

Note: This function is subject to the actual product development. Please consult the sales person for details.

Photovoltaic direct current, safe and high-efficiency

Self-generation and self-sufficient, eco-friendly and energy-saving

Real-time power generation benefit

Solve the problem of high electricity costs for conventional air-conditioning operations, avoid peak-to-valley arbitrage operation in areas where there is a price difference between peak and valley power, save combiner box and labor costs, convenient engineering installation, and real-time grid connection of excess power, which improves efficiency and reduces costs.

Healthy Product

► ERV+DX COIL

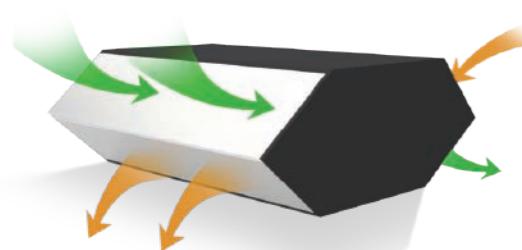

This series are fresh air units with evaporators, which means they have total heat exchangers and evaporators. When it's used with outdoor units, it can deliver fresh air without increasing the indoor load. They have multiple operation modes and are widely applicable.

- Memory function
- °C/°F switch
- Easier maintenance
- Centralized control
- Weekly timer
- Child lock

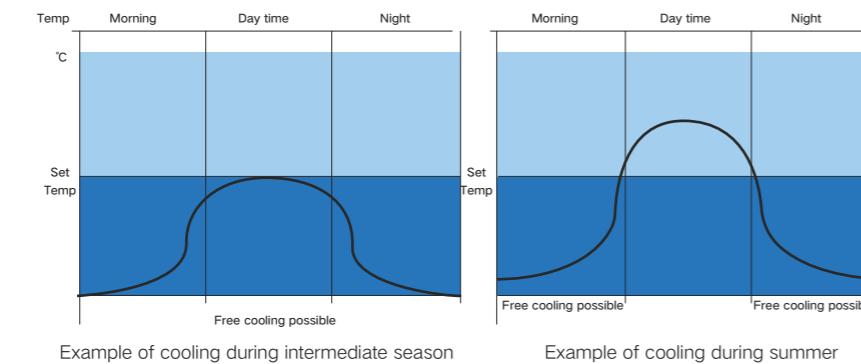

High-efficiency HR module

They are built with heat exchange chips for efficient energy recovery on the air discharge side. When they are in use, other air conditioning equipment will consume less power.

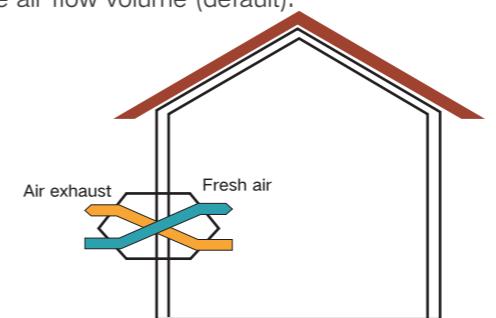

Free cooling

When outdoor temperature is lower than the set temperature, units can automatically introduce the fresh outdoor air to make the room cooler. In transition season, free cooling can always be valid; under large temperature difference of day and night in summer, the free cooling mode can also be activated to cool down the indoor temperature.

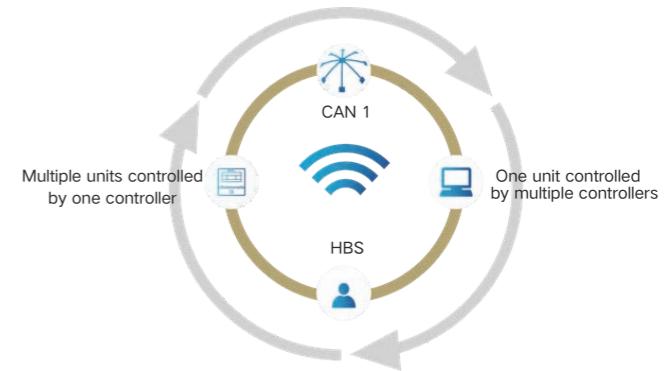

Multiple air supply modes

Positive pressure air supply: Different air flow volume can be set for the fresh air side and air discharge side to keep the indoor side under minor positive pressure, which will help guarantee room cleanliness; Negative pressure air supply: Different air flow volume can be set for the fresh air side and air discharge side to keep the indoor side under minor negative pressure, which will help prevent leakage of indoor pollutants. Balanced air supply: The fresh air side and air discharge side can be set with the same air flow volume (default).

Linked control

Units can be connected to other indoor units in the same CAN and HBS networks for linked control.

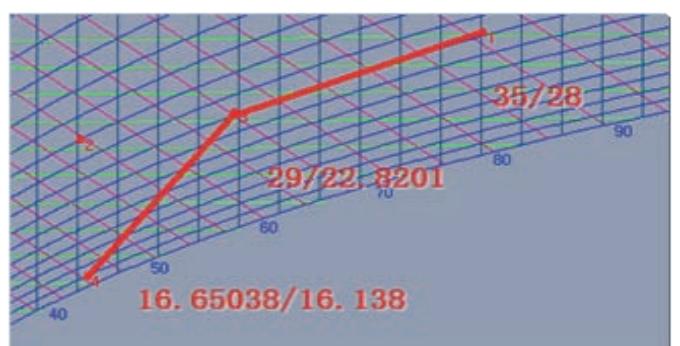

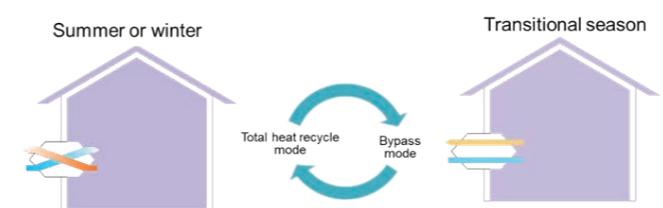

Cooling and heating functions

With fan coils, they have cooling and heating functions like common air conditioners. For example: Under the condition of 35°C (RH60%) for outdoor temperature, 27°C (RH50%) for indoor temperature and 73% of heat exchanger efficiency, when the fresh air passes through the core heat exchange, and it reaches about 29°C ,and then the fresh air is further cooled down and dehumidified by the evaporator, so that the fresh air reaches the appropriate temperature and then sent into the room.

Multiple operation modes

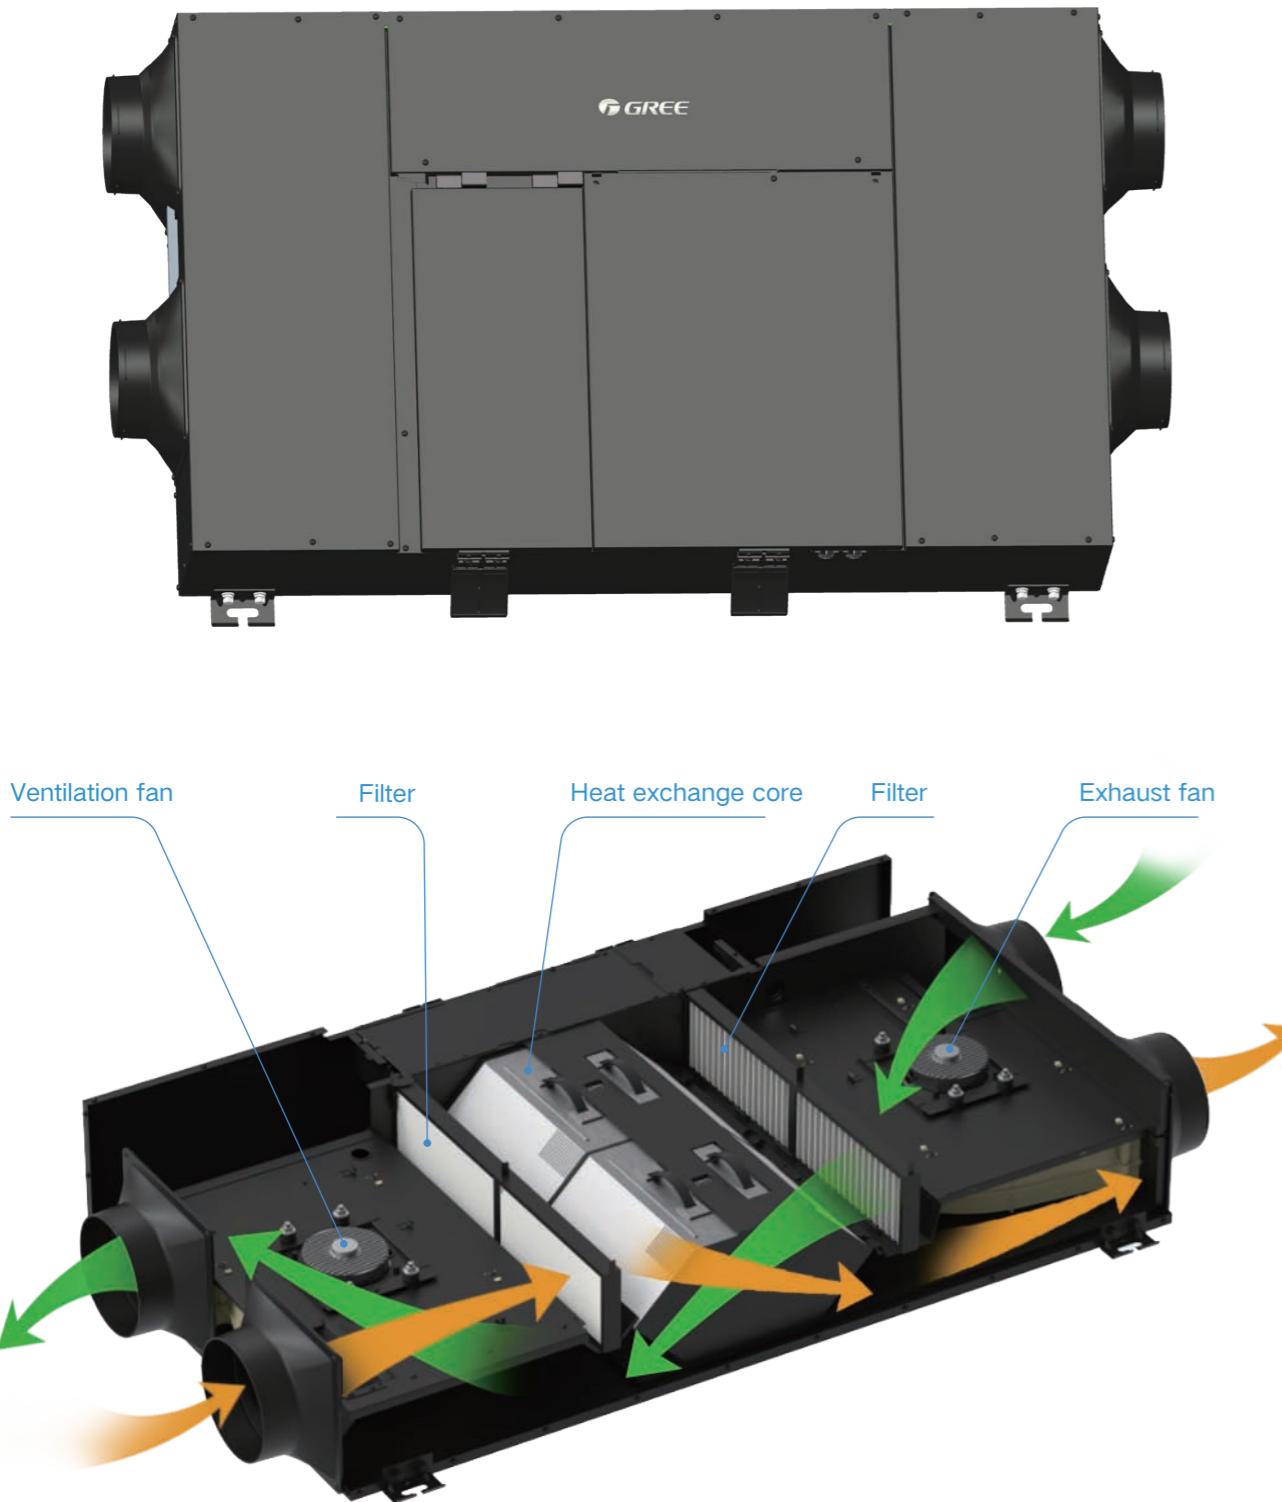

Total heat exchange mode: There is heat exchange at the fresh air side and air discharge side for efficiency energy recovery. By-pass mode: Ventilation without heat exchange. Air discharge mode: Only air discharge side is turned on for ventilation.

Standard wired controller			XE70-33/H	

ERV unit is an air terminal treatment equipment that can purify outdoor fresh air and exchange energy with indoor exhaust air. The unit consists of filter, total heat exchanger and fan. In the total heat exchanger, outdoor fresh air and indoor exhaust air exchange heat and moisture through counter-flow heat exchange, effectively reduce the load of fresh air, and finally send it into the room through specially optimized high static pressure fan.

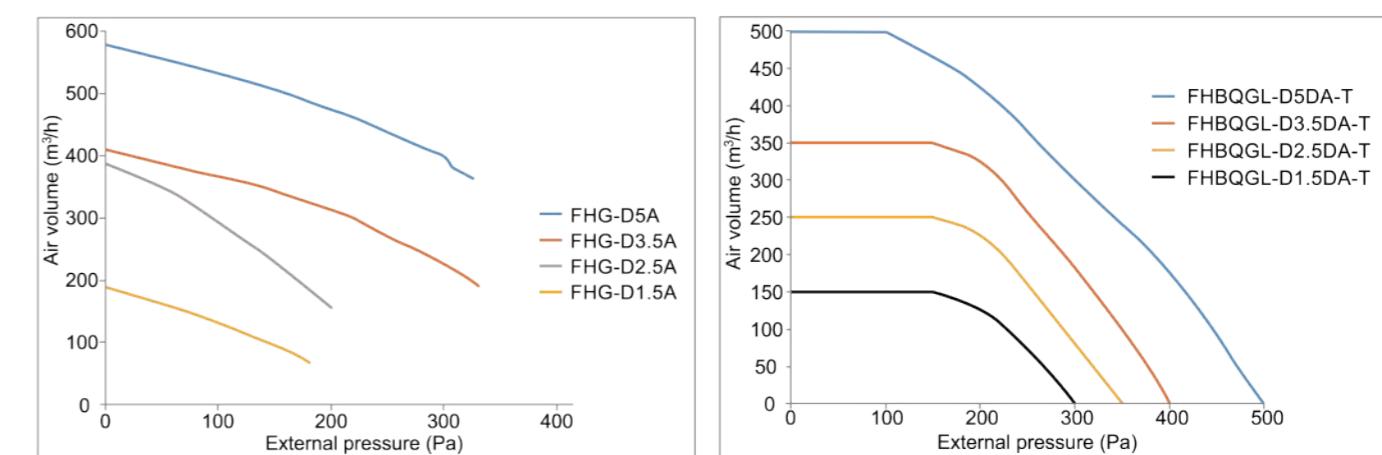

Ultra-thin Body, Convenient Maintenance

Thickness of the unit is 220mm/240mm, the ultra-thin body design meets the requirement that the unit can be installed on a ceiling in a narrow space; the unit adopts lower maintenance port, which is convenient for unit maintenance.

Constant Air Volume Control Technology

The unit adopts brushless DC motor stepless speed regulation and constant air volume control technology. Within a certain range of external static pressure, the unit judges through independent operation to keep the fresh air volume output constant.

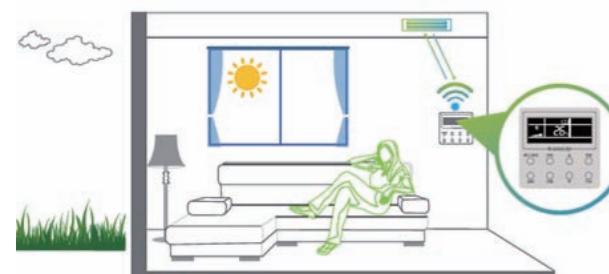

Multiple Control Methods

The unit can realize linkage control with multi VRF indoor unit (It needs to connect multi VRF system for this function).

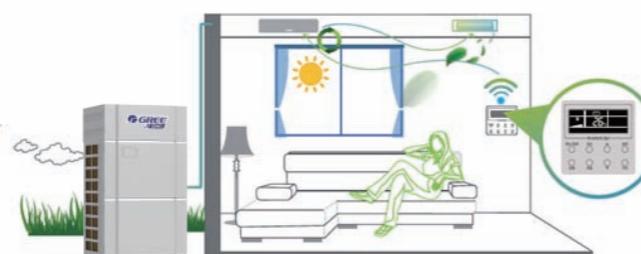

> Manual Control

By using the standard wired controller, users can manually control the start and stop of fresh air unit.

> Linkage Control

After connecting the fresh air unit to Gree multi VRF indoor unit through communication wire, set the wired controller of fresh air unit to linkage control mode. When the multi VRF air conditioning system is turned on, the fresh air unit automatically turns on to purify the indoor air; when the multi VRF air conditioning system is turned off, the fresh air unit automatically turns off, worry-free and energy-saving.

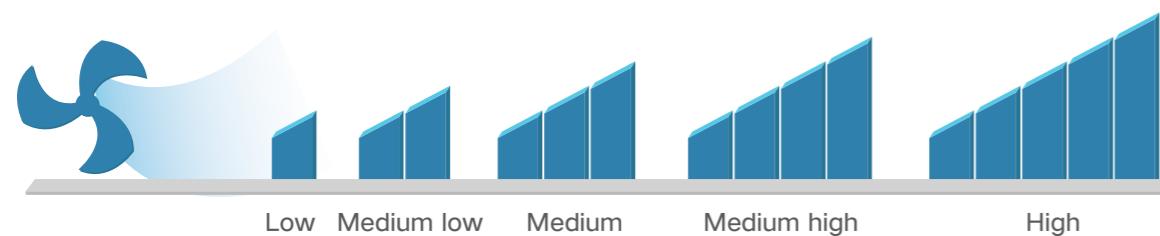

Two-way Flow Heat Recovery

The unit sends outdoor fresh air into the room, and at the same time exhausts the indoor dirty air. The fresh air flow and the exhaust air flow conduct counter-flow heat exchange inside the total heat exchanger to efficiently recover the exhaust energy, reduce the fresh air load, and save energy.

Multi-step Air Volume Control

The unit has five-step air speed for adjustment to meet the fresh air requirements of different houses and different piping sizes.

► Fresh Air Accessories

- 8% ~ 10% of outdoor fresh air can be effectively introduced.
- All-foam design, light and durable, used with 360 ° air discharge cassette type indoor unit, simple and convenient to install; double air inlets, using pressure difference principle, can automatically introduce fresh air without a motor, improving indoor air quality.

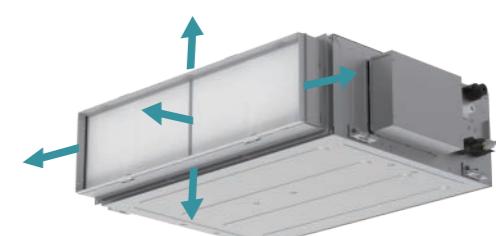

Model		XF150A-T
Fresh air intake volume	%	10
Dimension (W × D × H)	Outline	834×834×60
	Package	873×873×180
Dimension of the connection	mm	150
	Pcs	2
Net weight/Gross weight	kg	2.7/7.7

Note: This unit should be used with 360 ° air discharge cassette indoor unit.

► High-efficiency Filter

- The high-efficiency filter can effectively remove PM2.5. One pass purification efficiency ≥90%.
- Small air resistance and less volume attenuation.
- With 5 disassembly directions for convenient replacement and installation.

Filter model	Applicable for the following high static pressure duct type IDU
FKH01A(H)-T	GMV-ND22-50PHS/D-T
FKH02A(H)-T	GMV-ND56-80PHS/D-T
FKH03A(H)-T	GMV-ND90-180PHS/D-T

► Gree Reference Projects PV Project

 PROJECT NAME Insurance Company in Puerto Rico

Year: 2019
Product: PV GMV

The project is located in Puerto Rico, located at 66 ° west longitude and 18 ° north latitude. It is a tropical rainforest climate with a peak sunshine hours of 5.62h and the photovoltaic system installed capacity of 12.2kWp.

 PROJECT NAME Riyadh Alremal Residential Complex

Year: 2018
Product: PV GMV
Cooling Capacity: 6800kW

Big Residential Area Project, with 568 Villas, Mosques, Schools, Green Open Space, Offices, Roads and Parking Areas.

 PROJECT NAME Mohammed Al-Mana College for Medical Sciences

Year: 2018
Product: PV GMV
Building Area: 3000 (m²)
Cooling Capacity: 2700kW

MACHS was established in 2003, it is one of the higher education institutes that specialized in healthcare education and applied vocational training, located in the Eastern Province, Kingdom of Saudi Arabia.
MACHS excelled to promote the educational process for various health disciplinarians by following-up with the most advanced and updated programs to establish a distinctive quality standard for health education and its outcomes.
Academic collaboration and partnership with both the American University of Beirut and the University of Oregon in the US, which ensures the international standards of MACHS education.

 PROJECT NAME PAQSJ Institute of Medical Sciences

Year: 2017
Product: PV GMV
Cooling Capacity: 980RT

PAQSJIMS is a teaching hospital and was rated as a first-class teaching hospital in the medical center by the Ministry of Health. In addition to its three missions as a medical center (providing medical services, teaching and training, and research and development), PAQSJIMS usually provides the best medical services, and its main function during the war is to mobilize and integrate medical resources in different fields.

PROJECT NAME **Tosot Philippines Corporation**

Year: 2015

Building Area: 840 (m²)

Product: PV GMV

Cooling Capacity: 100kW

The first showroom of TOSOT, the mile stone of TOSOT brand image establishment in Philippines.

PROJECT NAME **University of Puerto Rico**

Year: 2018

Building Area: 30000ft²

Product: PV GMV mini

As a public university, the University of Puerto Rico has been offering post-high school education in various fields since 1903. There are 11 campuses throughout the island of Puerto Rico. Each campus is accredited by the Middle States Association of Colleges and Schools, which means the university of Puerto Rico's degrees are accredited by U.S. graduate schools.

The project has been refurbished to the east wing of the school building, which has four floors. It is currently being refurbished next to the school building. After completion, it will continue to renovate other campuses. UPR has a total of nine campuses.

PROJECT NAME **San Francisco Agricultural Project**

Year: 2018

Building Area: 8000 (m²)

Product: PV GMV

PROJECT NAME **Etqan Hotel**

Year: 2017

Building Area: 2000 (m²)

Product: PV GMV

The project is a farm located in San Francisco. With Gree photovoltaic VRF, the farm can supply the electricity power with solar energy, which is more efficient and environment friendly.

Note ▶

 PROJECT NAME

Year: 2018

Product: PV GMV

Cooling Capacity: 1933RT

The Park Inn by Radisson Hotel and Apartments Dammam Industrial City is the only international 4-stars hotel in Dammam 2nd industrial city. It's just a short drive to Dammam city center, 28 kilometers away, and you can easily explore the larger Dammam Metropolitan Area and nearby Dhahran.

 PROJECT NAME

Product: PV GMV

The project is located in Houston, USA, at 95° west longitude and 29° north latitude. It is a subtropical monsoon humid climate with a peak sunshine hours of 5.62h. The PV system installed capacity is 220kWp.
